

I kept slipping
on the last
slope

How can

$\{d' \rightarrow \{d \rightarrow R.r(R.r(d))\}.r(\{d \rightarrow R.r(R.r(d))\}.r(d'))\}$
not reduce?

That is just an
object literal.
A value

Stuff inside
{...} does not
reduce

```
{d' -> {d -> R.r(R.r(d))}.r({d -> R.r(R.r(d))}.r(d'))}
```

We need to call a method
using `{..}` as a receiver
to trigger the execution

`{d' -> {d -> R.r(R.r(d))}.r({d -> R.r(R.r(d))}.r(d'))} .r East`

But, what
about 'North'

I tough
'North' was
a value, but
it has no
'{...}'

'North' is a
value; and it
stands for
'North{''
Empty
parenthesis
can be
omitted!

I can see
the direction
of home!

Lets collect some
vegetables here and
let's hurry home
